DAILY BODY WEIGHT INCREASE

Lambs 2020

In 2020, we observed the weight gain of our lambs over a longer period of time through regular weighing for the first time.

The curves shown in the diagrams describe the weight of the heaviest and lightest male and female lamb. The dotted curves show the actual measured values, while the solid lines describe the trend of weight gain.

The actually measured data resulted in the following daily weight gains over the observation period:

sex	min. daily weight increase	max. daily weight increase
male	225g/day (171 days)	268g/day (168 days)
female	194g/day (135 days)	213g/day (172 days)

Values in parenthesis: duration of observation

Details of the investigation:

- 14 lambs, 9 male and 5 female
- Feeding: breast milk (the lambs stayed with the ewes for the entire observation period), grass, hay, small amounts of lamb feed

Thank you. We hope this information is helpful.
